3rd August 2026

Dear Luminate team,

I am writing to apply for the R&D Engineer I position. I currently work as an R&D Project Engineer at Tomorrow Biostasis GmbH in Berlin, where I have learned what it takes to deliver in a fast-paced start-up and where my designs end up in live medical cases. My skills are set out in my CV, so I wanted to use this note to say why this role in particular matters to me.

I first heard about Luminate Medical from Olivia Humphrey, a friend from university who worked with you as a product design engineer, and I started following the company in 2024. Our back-and-forth about her work is what got me interested, particularly Lily as it was what she spoke of most. I have always wanted to work on technology that helps people directly, and hearing how Lily could aid those facing chemotherapy stayed with me. My final year project on renewable energy and my first job out of university in the longevity sector came from that same instinct. Lily is the kind of product I would be proud to help build.

I found that first job in Berlin. I moved after graduating in 2024, and I have thoroughly enjoyed my two years here. I love to travel and see the world, but I have been looking to move home for a while now, and only for the right role in the right place. I have family and friends in Galway, including my niece and goddaughter, born in April and living in Clarinbridge. This move would be for the foreseeable future.

Wanting the move is not a reason to hire me, though, so I will be straight about where I would be starting from. I know I do not tick every box. My work is custom to specific ambulances and made in low volumes, rather than designed for manufacture. What I bring is an understanding of how to express ideas and work in a team, how to research quickly and produce a working prototype to test with, and how to iterate designs to get to the best final product. What I want to learn is precisely what you offer: how a device is carried through design regulations and approval to reach the patient.

If you would rather see my work than read about it, my CV links to a small project gallery, my final year thesis, a tour of the newest ambulance I built with my team, and an end-of-year case report I wrote, designed and created the technical graphs for.

Please do not hesitate to reach out with any questions. Thank you for taking the time to review my application. I look forward to talking with you further.

All the best,
Aaron Raftery
